

ACM Facades & Fascias

Bang & Olufsen

Bang & Olufsen have a philosophy that puts design at the centre of their business. It extends beyond product design and into all areas where customers interact with their brand. To make a success of its shop fronts, NES thought like B&O: it's not just a shop front, it's everything.

The designers at B & O wanted ribbons of Satin Black intersecting a tiled façade with the material specified as Dibond, because of its flawless finish, the designers turned to NES to help them realise their design.

The individual tiles were fabricated using either traditional CNC techniques or as with the case for the curved bricks, formed and rolled from a single sheet of Dibond. This eliminated any jointing problems and kept the fold radius of both type of brick consistent across the whole façade.

The effect is a perfect reflection of B & O design: simply stunning
